CAMS 81: Global and Regional Emissions

Description

The goal of this project is to provide gridded distributions of European and global anthropogenic emissions, as well as global natural emissions for the CAMS regional and global production chains. The emissions for a large set of atmospheric compounds will be developed from 2000 to the present, with addition of one additional year every year. These developments will be achieved through a close collaboration among the partners, and with the Global Service Provider and Regional Service Provider. Interactions with different types of users will also be developed.
