New approaches to the prediction of protein structure and interactions
The combined exploration of the sequence and structure spaces with large scale simulations leads to a new generation of highly accurate prediction methods useful in applications such as the design of new drugs.

Summary
The study and characterization of structural and dynamical features of protein-protein interactions is of paramount importance. Understanding how mutations in protein structures and functions arise and are transmitted during evolution will expand our knowledge on the mechanisms by which mutations contribute to diseases, including cancer.

Objectives
- Detection of species-specific coevolution
- Prediction of functional consequences of mutations

Barcelona Supercomputing Center - Centro Nacional de Supercomputación
