MADRID, Spain, July 1  
 /PRNewswire-FirstCall/  
 -- World Petroleum  
 Congress -- Driven by  
 the increasing demand  
 and rising costs for  
 energy worldwide,  
 Repsol YPF and the  
 Barcelona  
 Supercomputing Center

 (BSC) today announced  
 research results using

IBM supercomputers powered by the Cell Broadband Engine(TM) as the  
 standard for future hydrocarbon exploration. The preliminary findings  
 show IBM(R) BladeCenter(R) QS22 supercomputers, powered by the  
 IBM PowerXCell(TM) 8i processor, enable searching for oil fields at  
 greater depths up to six-times faster than conventional technology  
 currently deployed by the oil and gas industry.

The IBM PowerXCell 8i, originally developed for next-generation gaming  
 consoles, is a critical component to the development of a new class of  
 seismic technology enabling Repsol to locate oil reserves buried some  
 30,000 feet (10,000 feet of water and then 20,000 more feet of seabed)  
 below the Gulf of Mexico's surface. The U.S. Department of the Interior's  
 Minerals Management Service estimates the Gulf holds approximately  
 56 billion barrels of oil equivalent (oil and natural gas), which, at  
 \$130/barrel, would be worth over \$7 trillion and would meet the entire  
 U.S. demand for oil and gas for about five years.

Repsol and the Barcelona Supercomputing Center are using a process  
 known as Reverse Time Migration (RTM), a sophisticated subsurface  
 imaging tool accepted by the oil industry. It has proven essential for  
 imaging areas of complex subsurface geological structure, such as the  
 rich hydrocarbon provinces of the deep waters of the Gulf of Mexico,  
 offshore Brazil and West Africa. These basins are the new frontiers in oil  
 exploration, where significant oil reserves are present below thick  
 masses of salt that have made seismic imaging difficult. But the new  
 technology will accelerate and streamline oil and gas exploration in these  
 promising regions by several orders of magnitude compared to current  
 industry methods.

"Fidelity of the RTM images reduces the risks associated with oil  
 exploration in these prolific but complex areas," said Francisco Ortigosa,  
 director of Geophysics, Repsol. "However, the universal use of this  
 technology is limited by processing speed. The IBM PowerXCell 8i  
 processor's unparalleled speed for the imaging algorithm allows  
 extensive use of the technology. By speeding up seismic imaging, we  
 foresee a revolution in exploration that will be comparable to the  
 revolution in medical imaging technologies, such as MRIs, that today  
 routinely yield detailed images from inside the body."

RTM is one of the key efforts driven by the work of the Kaleidoscope  
 Project ([www.KaleidoscopeProject.info](http://www.KaleidoscopeProject.info)), a collaboration between  
 Repsol; the Barcelona Supercomputing Center; 3DGeo,  
 a Houston-based imaging company formed by Stanford University

professor and seismic imaging pioneer Biondo Biondi; and Stanford University's Stanford Exploration Project (SEP), a leading industry-funded academic consortium, whose purpose is to improve the theory and practice of constructing 3-D and 4-D images of the earth from seismic echo soundings. The Project utilizes new models, algorithms and the BSC, also called the "MareNostrum," one of the world's most powerful supercomputers, which features IBM's latest processing technology.

"The high-speed communications capabilities of the new IBM PowerXCell 8i processor in the IBM BladeCenter QS22 can help companies create and run vastly improved visual, immersive, real-time simulations," said Jim Comfort, vice president, IBM Systems & Technology Group. "These simulations are already helping companies like Repsol make significant headway in hydrocarbon exploration by allowing them to locate energy reserves previously unknown. IBM has built a strong ecosystem around the new QS22 to address critical real-time analytic and imaging projects, and Repsol is a great example of a company reaping the benefits."

"Kaleidoscope is a pioneer project showing the industrial impact of a new generation of high performance heterogeneous processors with one order of magnitude increase in performance and a power consumption decrease of one order of magnitude. Kaleidoscope produces its first results at the same time that the Petaflop barrier is broken by a Cell based computer," said Jose M. Cela BSC CASE Department Director.

#### About Repsol

Repsol is an integrated international oil and gas company, operating in more than 30 countries and is the leader in Spain and Argentina. It is one of the ten major private oil companies in the world and the largest private energy company in Latin America in terms of assets.

From exploration and production to marketing, Repsol is present in all stages of the business. With an oil and gas production of over 1.1 million barrels of oil equivalent per day and a refining capacity that surpasses 1.2 million barrels per day, the company operates nine refineries, and is the leader in Spain, Argentina, and Peru.

Repsol sells its oil products through a wide network of 6,800 sales outlets spread over Europe and Latin America. In chemicals, Repsol is the top-ranking producer of petrochemical products in Spain and Portugal. In the liquefied petroleum gas business (LPG), it is the third largest company in the world and one of the most efficient operators. Repsol also distributes natural gas, directly or via its affiliates, to over 9 million customers in Spain and Latin America. For more information, visit [www.repsolypf.com](http://www.repsolypf.com).

#### About Barcelona Supercomputing Center (BSC)

In 2004 the Ministry of Education and Science, the Generalitat de Catalunya and the Technical University of Catalonia took the initiative of creating a National Supercomputing Center in Barcelona. The Barcelona Supercomputing Center -- Centro Nacional de Supercomputacion (BSC) is the National Supercomputing Facility in Spain. Established in 2005, BSC manages MareNostrum, one of the most powerful supercomputers in Europe.

BCS is a research center in Computer Sciences as well as in fields that demand high performance computing resources such as Life Sciences and Earth Sciences. Following this multidisciplinary approach, BSC brings together a critical mass of researchers, high performance computing experts and cutting-edge supercomputing technologies in order to foster scientific progress.

For more information about BSC, please, visit [www.bsc.es](http://www.bsc.es).
